

## **Wood or pellets? Both! - With the ETA Twin**

*Heating with logs is unbeatably affordable. Heating with pellets is conveniently fully automatic. With the ETA Twin you can switch between both systems. The changeover from one combustion chamber to the other is fully automatic.*

Those who have wood of their own or perhaps can cheaply buy it in the neighbourhood can heat in an extremely environmentally friendly manner and very cheaply. But what if you don't have time to add fuel? Don't want your house to get frozen over while on vacation? Do you want to return to a home with a nice temperature after work?

With the ETA Twin that's no problem! If there are no logs in the combustion chamber, the intelligent combined boiler switches fully automatically to pellet operation. You don't have to worry about the pellet burner. It ignites automatically – and noiselessly with a ceramic igniter and automatically fetches its fuel from the pellet store via a suction mechanism.

### **Two combustion chambers, one device**

Automatically switching from one system to another is so easy because the TWIN consists of a fully-fledged wood gasifier and a fully-fledged pellet burner. Both devices are perfectly adapted to their respective combustion materials: a patented hotzone combustion chamber ensures a particularly thorough burn-out in the log boiler. And with the aid of a lambda probe the boiler automatically adapts the supply air to the current wood quality. This achieves the best possible heating output from any wood.

The lambda probe detects the suitability of the combustion material in the pellet burner too. In both devices, efficient systems ensure problem-free cleaning and de-ashing. That's comfort and money saved!
