

A lot of output from a few square metres

The ETA PelletsCompact 40 to 105 kW works efficiently, is environmentally friendly, clean and of course fully automatic. It is ideal for apartment buildings, commercial and industrial buildings. It is not only suitable for new builds, but it is also the ideal replacement boiler if you wish to switch from fossil fuel.

The ETA PelletsCompact with a heat output of 40 to 105 kW is a miracle of compact design. Needing just a few square metres, it works highly efficiently and cleanly. Dust and dirt are a non-issue in the boiler room.

A clean heating boiler works better

The interior of the boiler is also cleaned with a heat exchanger cleaning and de-ashing. This allows the fuel to be used more efficiently. The ash box has to be emptied occasionally.

Small format - large technology

The goal of an efficient heating solution is to achieve a high degree of efficiency with low emissions over the entire heating season. That is why the ETA Pellet boiler is fitted with specialised technology from factory: a lambda probe detects the condition of the combustion material, so that the fuel feed and the air supply can be automatically adapted to the wood quality. And because a central control system for the whole heating system saves energy, the buffer, heating circuits and solar heating system can also be integrated into the boiler control system.

Touchscreen and remote control via internet

The control system itself functions via a large touchscreen, which is located directly on the device. The self-explanatory images make setting the heating child's play. It can also be controlled via mobile, tablet or PC. The free "MeinETA" platform allows you to monitor the whole heating system, control it remotely and also authorise someone else for access.
