

Great performance in just a few square meters

The ETA PelletsCompact 20 to 105 kW works efficiently, environmentally friendly, cleanly and of course fully automatically. It is ideal for apartment buildings, commercial and industrial buildings. It is not only suitable for new buildings, but is also the ideal replacement boiler if you want to switch from fossil fuels.

The ETA PelletsCompact with a heating output of 20 to 105 kW is a miracle of compact design. It works extremely efficiently and cleanly on a few square meters. Dust and dirt in the boiler room are not an issue.

A clean boiler works better

The inside of the boiler is also automatically cleaned with a heat exchanger cleaning system and ash removal system. Because in this way the fuel can be used more efficiently. The ash box only needs to be emptied occasionally.

Small format - great technology

The goal of an efficient heating solution is to achieve high levels of efficiency with low emissions over the entire heating season. The ETA pellet boiler is therefore equipped with specialized technology as standard: A lambda probe detects the nature of the fuel, so the fuel feed and air supply can be automatically adapted to the wood quality. And because central control of the entire heating system saves energy, buffers, heating circuits and solar systems can also be integrated into the boiler control.

Touchscreen and remote control via the internet

The control itself works via a large touchscreen directly on the device. The self-explanatory images make adjusting the heating child's play. It can also be controlled via mobile phone, tablet or PC. With the free platform "MeinETA" you can monitor the whole heating system, control it remotely or give someone else access to it.
